When the appliance is switched on, the current is several times greater than the nominal current.

“The switch-on current of appliances must be taken into account when determining the cross-section of the conductors and choosing the systems that protect against excess current, in order to avoid excessive voltage drops during the switch-on period and the untimely triggering of the protective device.”

We advise you to use a protective device specific to the switching-on of asynchronous motors. In every case, you must comply with the legislation currently in force.
